

Don't go "poof"!

Following several month of development and testing we are proud to present: The Spradow test coupling for nitrogen and other inert gases.

Our goal was to realise the usual high Spradow quality at reasonable costs while also ensuring the filling purpose of the coupling.

These goals were fully achieved and we are happy to already have proof of the every day and mass production efficiency of this coupling. As the development was in correspondence with customer specifications and suggestions these coupling have not only been thoroughly tested - they are already in satisfactory use since some month. The feedback is phenomenal and encouraged us to let all our customers benefit from our results.

We have been able to constructionally solve the well-known problems of higher corrosion affinity which occur under special conditions. For this case we offer a special, extended version. Furthermore, we have an appropriate version for cryogenic temperature appliance.

Test us! Place your sample order this very day and get convinced of our quality.

Moreover we are pleased to invite you to our new website! www.spradow.de has been completely revised and made over. Technically updated and well-structured - your desired information, even faster to find and just a mouse click away.

Next to general information and the latest catalogues you can naturally find the [new catalogue](#) for the nitrogen coupling described above.

Do you have questions for this?
We have the answer!
